Project Title: Integrated Hotel Booking And Guest Experience Management System

Module Photographs:

Architecture: (Admin side)

Available rooms

Royal Palace Suites

Guest reviews

Mevalurkuppam, Tamil Nadu, India

Module Description: Admin Panel (Hotel and Booking Control)

The Integrated Hotel Booking and Guest Experience Management System is a web-based application designed to simplify hotel reservations and improve the overall guest experience. The system provides a centralized platform where users can register, log in, browse cities and hotels, view room details, check real-time room availability, make bookings, complete payments, and access their booking history. It consists of three major modules: the Admin Panel, which manages hotels, rooms, customers, bookings, cancellations, and reports; the User Portal, which supports hotel browsing and room reservations; and the Payment & Billing System, which calculates the payable amount, maintains payment status, generates invoices, and sends confirmation notifications. The application is developed using HTML5, CSS3, Bootstrap 5, Core PHP, MySQL, SQL queries, and session-based authentication, with XAMPP providing the Apache and MySQL server environment. The system uses database-driven operations and backend validation to maintain accurate records and reduce duplicate or invalid bookings. By replacing time-consuming manual booking procedures with an organized online platform, the system reduces administrative workload, improves booking accuracy, provides convenient access to hotel services, and enhances guest satisfaction. The system can also be extended in the future with dynamic room pricing, mobile application support, personalized offers and loyalty features, and automated chatbots for guest assistance.
